---

Dear Hiring Team,

I'm Fahad, an AI Engineering master's student at THI Ingolstadt, and I'm reaching out because I'd like to bring what I've been building in reinforcement learning and robotics into a real team. Over the past few months, I've trained reinforcement learning agents from scratch Q-learning and DQN, with reward shaping and experience replay, built a computer-vision pipeline that lets a robotic arm sort objects on its own. What I liked most about both projects wasn't the algorithms themselves, but the process of taking something that barely worked and making it reliable: fixing seeds, comparing variants fairly, and tracking the right numbers to know when something had improved. Before the master's, I spent two years in enterprise IT, mostly making sense of messy operational data and turning it into reports people could act on. It wasn't glamorous, but it taught me to care about whether something actually works for the people using it - a habit that still shapes how I approach technical work now. I'd like to bring that mix of hands-on ML and practical grounding to your team, whether that's as a working student, an intern, or through a thesis project.

I'm based in Ingolstadt, eligible to work up to 20 hours a week, and happy to share code or walk through any of my projects — a few are live on my site above. Thank you for considering my application.

Kind regards,
Fahad Mollah
